Corporate Bond Market Distress Index (CMDI)

The CMDI is a summary metric of U.S. corporate bond market functioning.

The Corporate Bond Market Distress Index (CMDI) quantifies joint dislocations in the primary and secondary corporate bond markets to construct a unified measure of market conditions. While there are a variety of measures for capturing aspects of corporate bond market functioning, there has been little consensus on how to use those measures to identify periods of widespread distress in the market and on how to weight different measures.

The index incorporates a wide range of indicators, including measures of primary market issuance and pricing, secondary market pricing and liquidity conditions, and the relative pricing between traded and nontraded bonds.

The CMDI estimates and brief commentary are published at or shortly after 10 a.m. on the last Wednesday of each month.
